
how to build a \'search\' page

Posted by medeino - 2018/04/07 07:20

Good morning,

I would like to build a page like this using ari data tables that I've just bought:

a page with only 'search' part where the user can write a neme (or a beginning of a name);

after that another page (or the same) where to list all the occurrences in a jommla table with that name written previously.

Could you help me please?

PS I'm not a developer

Thanks a lot

Hello,

Set "Choose table type" parameter to "ARI Data Table" in module settings and enable "Choose table type -> ARI Data Table -> Show search input" parameter.

Regards,
ARI Soft

thanks a lot for your help.

I would like to do something different:

- 1) user can see the search part only and no rows (see page1.png)
 - 2) after digiting something in search field all the rows select are visible

I re-insert page1 in another format <http://www.ari-soft.com/images/fbfiles/files/page1.doc>

The extension doesn't work in this way. The possible solution, you can create a new page with HTML search form and send data from it to a page with "ARI Data Tables" module. The similar solution is described [here](#).

Fantastic!!

It works very very well!

Thanks a lot for your help!

Great!
