
Prevent the data to be leaking?

Posted by niki - 2019/01/14 12:54

Hi,

We are using ARI Data Tables but today i found something very strange and to be honest stupid. When you check the source code of the page you can see all people names? Is this normal behavior? I will send email to your email so you can check what i'm talking about.

Hello,

If you show data from a database, the extension can work in two modes. The first one is loading all data on client side and doing all manipulation (sorting, filtering) on client side. Another mode is server side pagination. It seems you need the second mode, for this set "Server side pagination" parameter to "Yes" in module settings.

PS: It doesn't work for CSV files.

Regards,
ARI Soft

Source type is SQL.
I send you email to see the page
