
Showing CSV files

Posted by ibewguy - 2019/01/23 03:31

Hello,

I have tried everything to get this plugin to work with CSV files and have failed. There is very little documentation and I would like to use it with a csv - its fine when using my Joomla database, but I have never been able to get this to work with csv - i've tried several times. Does anyone have any insight they could share?

John

Hello,

In most cases it is enough to only specify path to CSV file. See "Choose source type -> CSV -> Path to CSV file" parameter. For example if db.csv file is located in /images/report folder, populate the parameter with the following value:

images/report/db.csv

If nothing helps, could you a link to a page where you try to show data from CSV file and screenshot(s) of module settings page by email?

Regards,
ARI Soft

Hey John

I think got the exact same problem. When I set the "path to csv" and save, the page is reloading and my settings are gone?!?

Did they solve Your Issue? Maybe You can tell me faster what the problem is / was :)

Hello,

If you use "Advanced Modules" extension, try to switch to standard Joomla! module manager.

Same issue, unfortunately that's a deal breaker for me as I rely on Advanced Module Manager. Are you going to fix this?

Hello,

Download the updated version in "Member Area" on our site and upgrade it on your site (just install it via Joomla! installer). New version should work fine with "Advanced Module Manager".
