Removing Database connection
Posted by MJ_ITDept - 2019/01/24 18:07
_____

I have a Joomla site that is using ARI Data Tables for some reporting functions. It connects to a DB on the local server and performs the query. It is working fine on our production site. Unfortunately, we need to update our PHP on that server, hence a full upgrade of the site.

I used Akeeba Backup to backup and restore the site to a Sandbox account on the same server. The Sandbox account has PHP 7.2 versus PHP 5.6 on the production account. I have also imported all of the databases and everything is ok from that respect. I can see data using phpMyAdmin.

I am using the latest version of ARI Data Tables â€" 1.16.4

I have attempted to change the database credentials in two modules and have had the same results. I have not attempted on the 3rd and last module yet.

I open the module and edit the DB credentials. Everything looks fine until I save the module. Then the DB type switched to â€œJoomlaâ€• and all of the credential info as well as the Query are gone. Luckily, all of the column settings are still there.

I am using the Google Chrome browser to edit the site. I just tried in IE as well and had the same result...

Any ideas?

Hello,

Is it possible to see the problem anywhere?

Regards,
ARI Soft
