
#0 Call to undefined function create_function()

Posted by koebi - 2021/09/14 20:06

I am very happy with the tables but recently my ARI Datatables
(<https://www.strickler.info/index.php/willkommen/portraits>) are no longer displayed and I get the above error message.

In the meantime I have also installed the new version (1.16.5) but without improvement.

What is going wrong?

Hello,

Do you use PHP 8? If yes, currently the extension doesn't fully support it.

Regards,
ARI Soft

Bingo, that was the solution, since I downgraded php to 7.4 it works fine again - thanks for the tip.

Is perhaps already known when php 8.0 is supported?

Hi,

I know this topic is old. I would to update my site to php 8. Is there an update on when this module will support php 8? Is it planned?

Joomla admin message is:

"Warning Your PHP version, 7.4.30, is only receiving security fixes from the PHP project at this time. This means your PHP version will soon no longer be supported. We recommend planning to upgrade to a newer PHP version before it reaches end of support on 2022-11-28. Joomla will be faster and more secure if you upgrade to a newer PHP version. Please contact your host for upgrade instructions."

Thank you.

Hello,

Currently it doesn't support PHP 8.x. We don't have an ETA when it is ready.

Regards,
ARI Soft

I have the same problem. PHP 7.4 will no longer be supported in 6 weeks. Then PHP 8 must be switched on. This causes Ari Data Table to stop running.

Or does anyone have an idea how Ari Data Table works under PHP 8.
