
GChart - Bar Chart

Posted by kraftgroup - 2010/09/22 13:07

Can you point me in the right direction to edit the display of the bars?

Our naming on the left of the bar cannot really be shortened, and I was wondering if this is a CSS hack that need to be done in `modules\mod_aridatatables\includes\js\widgets\datatable\css` or if it has to be done in some other coding file...

see attached image for example http://www.ari-soft.com/images/fbfiles/images/IMG_01092010_090823.png

Hello,

It can't be done with help CSS because graphic and labels are drawn with help SVG (Canvas in IE), but we updated module and now it provides new parameters 'Label length' and 'Truncated label postfix' which you can use that truncate labels for 'GChart' widget.

Regards,
ARI Soft
