## Filtering {aridatatables}

Posted by ctdh - 2010/09/29 15:08

---

I have set up a plug and I have used it in Joomla! content to reference moduleId 87:

```
{aridatatables moduleId="87"}{/aridatatables}
```

I have two questions:

Is it possible to get the same result by embedding the parameters I have set in the module into the Joomla! content page? Can you give an example?

Is it possible to dynamically filter the results by http request querystring. Can you give an example? I have installed the DirectPHP plugin.

Do I need any other modules to do this?

Thanks

Hello,

'ARI Data Tables' is Joomla! module not a plugin. It doesn't provide possibility to set parameters into {aridatatables} tag. 'Content - ARI Data Tables' plugin only can load 'ARI Data Tables' module into articles and the module doesn't provide ability to use PHP commands. If you want to embed data tables with help plugins, you can be interested in ARI Smart Content: DataTable Pack extension.

Regards,  
ARI Soft
