
Sorting according to \'Name\' rules?

Posted by pheitman - 2010/10/25 23:09

I'd really like to be able to sort Names with the same kind of rules that iPhone/iTouch/iPad apps use. That is, sort by Last Name even though the field is Name (not separated in to First and Last names). For example, "Peter Heitman" would sort by "Heitman", and "Bob Smith Jr." would sort by "Smith".

I don't suppose that ARI Data Tables can do that today. Is there any way to extend the sorting algorithms in a custom way?

Peter

Hello,

Currently the module doesn't provide this ability but we'll think about implementation of this possibility.

Regards,
ARI Soft
