
Cache Problems

Posted by mido1960 - 2011/04/20 21:22

Hello,

I just upgraded to Joomla! 1.6.3 and also upgraded to the latest version of Ari Image Slider 1.5.7 and noticed that the slideshow does not work properly when the the cache is turned on in global settings (I always set it to progressive caching). As soon as I clean the cache it starts to work fine but after a little while it gets all messed up again. What am I doing wrong?

Thanks in advance for your input!

Hello,

Could you provide link to page where we can see the problem?

Hello, thanks for your response.
Here is a link:

www.caribbeanworkboats.com

It might take a little while until the cache builds up, I just turned it on again.

Could you inform us when we can see the problem on provided page? Now the module works fine.

I just checked, you can see it now! You have to wait a until the sequence runs by a couple of times until you see it!

Download and upgrade "ARI Image Slider" module and then clean Joomla! cache. We suppose it should help.

Hello, that is what I did (if you look at my first post).

Of course it works again for some minutes, when I clean the cache (I described that before). But I need a solution, not a "patch" for two minutes.

Please tell me, if there is a solution for this, before I have to look for another slideshow.

Thanks for your effort.

I turned off the cache again.

If you need it activated again to check what it looks like, please advice!

Thanks again

You haven't updated the module. "ARI Image Slider" v. 1.5.7 is installed on your site, but the latest version is 1.5.8. We wrote about extension's updated in our previous post.
