
How to make ARI Image Slider to autoresize smaller

Posted by omdawe - 2012/11/13 11:27

I testing with on Joomla 3.0 and what i like with it is that the template is auto resizing the width of the template to smaller if used on mobile phone/tablet or a small window. Is it possible for ARI Image Slider to do the same?

So have maybe 980 px width and 200 px high but if the screen size is smaller then that is would keep the ratio.

Thanks for a easy and good module!

Hello,

Set "Responsive" parameter to "Yes" in module settings.

Thanks for the quick response!

Could not find that parameter so i tried to check what version i got "installed" and could not find where is says that.

So i downloaded the latest one from your website and check the file size of the file i downloaded on 2012-10-18 and the one i just downloaded.

As the new one was bigger size so i tried to "install" that one and voila there is the parameter.

Thanks for the help but maybe your could have version number in the file name or in the module that would be easier.

But sweet anyway for the quick fix!

Version number for any module can be found on "Extensions -> Extension Manager -> Manage" page on Joomla! backend.

I tried to set the responsive to 'yes'

it show correctly in tablet and mobile screen
but not in desktop screen, the slider become very small

how to troubleshoot

can check on here, and try to resize the browser

Hello,

This problem with site template styles. 370px width is defined for container of selected module position.

Hi,

I have followed instructions here but do not have the Responsive parameter in the Module settings. I am using v1.2.1 downloaded from your site today. Can you pls advise where it is?

Thanks

Gareth

Hello,

The latest version of the extension is 2.0.7 and only this version can be downloaded from our site here.

Thanks for the superfast response. My apologies I realised I was using the ARI Orbit slider and not the Image slider. The Image slider has installed properly and responsive parameter is working like a dream.

One follow up question though - can I use captions on the Image slider? if so how do I activate these. It is not picking up descriptions from the ini file.

Thanks again

Gareth

Titles can be defined in INI file. Check that INI file is located in folder with images and has correct format.

Is only the resolution smaller or the image too? (Megabyte size)

It doesn't change images. Only slider size.
