## Menu behind ari image slider on mobile devices.

Posted by morten44 - 2013/06/10 18:32

Hi

<http://new.uffnorge.org/>

Thanks for a very good extension and its responsive!!!! Cool

I have one problem and that is that standard menu looks good but when looking at mobile devices the menu falls behind the ari image slider

You can simulate the problem by making your browser 1/3rd of the width. That will activate the mobile device layout

I have tried to add z-index values to nearly every single CSS code but I am stuck. I have seen the other post here but i can see they refer directly to the template they have used and I am not able to implement it

Can you have a look at it for me please and see if you can give some advise?

Thanks alot for your time

Hello,

Add the following CSS rule:

```
#s5_responsive_mobile_top_bar_wrap
{
  z-index: 2000 !important;
}
```

Regards,

ARI Soft
