
Problem with arisoft plugin, mootools last version

Posted by chirillo77 - 2013/07/16 21:20

Ari image slider is not working on the other pages of the website, only on the main page - <http://svetdom.by/>
On this pages it is not working and of course it is published in modules:

<http://svetdom.by/template-layout>

<http://svetdom.by/template-layout/menutsvet>

<http://svetdom.by/template-layout/usvet>

<http://svetdom.by/template-layout/svddomamenu>

I installed mootools last version through ftp, and i think this is the problem. Or i am not right? by the way ari image slider was working on the other pages a bit after i installed mootools. So maybe it's not a conflict between jquery and mootools? If it is, should i use script no conflict? And where should i put it?

```
jQuery.noConflict();
```

Help me to return ari image slider on this pages please.

<http://svetdom.by/template-layout>

<http://svetdom.by/template-layout/menutsvet>

<http://svetdom.by/template-layout/usvet>

<http://svetdom.by/template-layout/svddomamenu>

Hello,

It can be a problem with Joomla! cache or site template because javascript code is loaded for module instance with ID = 56, but HTML code is loaded for module instance with ID = 53.

We can investigate the problem in more details if you provide a temporary access to your J! backend by email.

Regards,
ARI Soft

This problem with your site template. It doesn't contain the following code between `<body>` and `</body>` tags:

and you load all javascript and CSS files manually. It is incorrectly because Joomla! extensions load necessary files by yourself.

How can I fix head tag? In which file?

And what do you mean by: you load all javascript and CSS files manually. I don't understand. How can I fix that? Sorry if my questions sound silly, I am the beginner in Joomla.

If you modify index.php file of site template then return back original code between `<head>` and `</head>` tags. If someone modifies or create site template for your, contact this person so s/he fixes the problem because currently most of Joomla! extensions will not work with your site template.

Regards,
ARI Soft

Fix tags is not difficult. What about java script and css? You mean I shouldn't upload extensions through ftp?I didn't add files manually(javascript and CSS.) Tell me please how I can turn them on by Joomla standart (2.5 version)

Open index.php file of site template and you see CSS and javascript files which is used by "ARI Image Slider" module are loads directly in site template file. It is incorrectly. Joomla! extensions say what files (javascript code) should be added via Joomla! API and then site template loads it using the following code:
