## Not scaling properly in responsive

Posted by kwood - 2016/08/06 20:46

---

Hi there. I have ARI Image Slider 2.2.1 and Joomla 3.6.2.

I have the image slider set up on a particular page in responsive mode:  
<http://www.arahuoriginals.com/custom-work>

It has a single image right now which is 1024x768. However in my full screen browser, it is cropping the image height. When I click on the image to open it in a lightbox, it shows the full image. Also, if I reduce the size of my browser screen, it starts to scale the image properly.

Any suggestions?

Hello,

Could you send a screenshot where we can see the problem?

I did provide a link so that you can see it live, but here are the screen shots.

Looks like I can only attach one image per comment, so here is the full screen browser screenshot where you can see that the image height is cropped. <http://www.ari-soft.com/images/fbfiles/images/fullscreen-70dd4cf4a003fda43541338a958ac889.jpg>

And here is a screenshot with the browser window scaled down. You can see that the photo is no longer cropped.

This problem with the following custom CSS rule:

```
.ari-image-slider{max-height:500px !important;}
```

which is added by site template.

Thanks very much!

I wonder why the template authors put that in their template?

Ask this question site template authors.
