
SOLVED how to optimize space between cloud items

Posted by eropuitinbrabant - 2011/02/23 15:39

Hi guys, here's another challenge.

How to optimize the space between the cloud items to display them as a menu. The items are all .png files with a default width of 300 pixels and 40 pixels height. i tried 200*40 pixels before, but that doesn't affect the space between the cloud items as a result. How to take influence on the space between the cloud items so that the separate png files are exposed in a readable way? It should become 67 items as a total. in the example below there are only 16 items added so far. 50 to go, but first I need to be sure that it does make sense to continue. <http://www.ari-soft.com/images/fbfiles/images/settings01.jpg>

Hello,

Read about carousel size in this post please.

Regards,
ARI Soft
