Speed

Posted by cassie - 2012/01/24 23:45

_____

When I set up the module, it looks great and works beautifully except for the speed. The slides start going faster and faster until they're zooming around at a super high speed. The animation also doesn't stop at any of the images. What am I missing that would change this?

_____

Hello,

Provide a link to a page please where we can see described problem.

Regards,
ARI Soft

Okay, I think that I have the problem sorted out and it seems like it's inherent in the Cloud Carousel program. I wanted the images to move slowly (older audience and fewer images) and lower speeds apparently make the images work improperly. I can get the speed down to .08 without trouble, but around .05 or lower the images stop obeying the normal routine. They start pausing for less and less time and when they don't stop properly, their speed starts increasing.

The current speed setting is .08 and I'm afraid that's as slow as I feel the program can reliably go. The problem I was experiencing still happens a bit if I navigate off the page and return to it. The carousel zooms around for a moment before returning to a normal speed, but when people are actually viewing the page it seems to be working.
