## Site cannot be reached & undefined index: mime

Posted by jomojo - 2017/06/16 18:05

---

Hello all,

This is fix to a problem I encountered using ARTIO JoomDOC with Doc viewer. I was getting the 'This site canâ€™t be reached' error on displaying document detail.

Once Joomla site debugging was enabled, this then showed  
Undefined index: mime in /var/webs/blah.org.uk/libraries/arisoft/Arisoft/Joomla/Document/Includesmanager.php on line 99

The lines of code at this reference are:

```
if (is_array($type))
    $type = $type;
$differences = sprintf(" %s", $type, $script);
}
```

The fix was to define the value of 'mime' as 'application/javascript' (what researched told me the 'type' should be).  
The amended code is as follows:

```
if (is_array($type))
    $type = $type = 'application/javascript';
$differences = sprintf(" %s", $type, $script);
}
```

I hope this is helpful to other people.

Hello,

Check that you use the latest version of the plugin (2.1.2). It contains fix for this problem.

Regards,  
ARI Soft

You're absolutely right - It does :)

Just a note on the installer package - It's not tidying up after itself and leaves 'ghosts' of previous versions in Joomla Extensions.

Deleting these ghosts also deleted the files for the current version - Whoops!  
All fixed by reinstalling the current one.

Thanks again.
