
Books or categories do not show up

Posted by fritz_fratz - 2021/07/02 07:51

Hi,

I tried everything to show an ari smart book module in 2 different websites. The only methods which are successful are to create a menu item which shows directly to a specific document and to use {arismartbook id="BOOKID"}. Categories or books in modules do not work. I use joomlashine templates.

It would be nice if you can help me.

Strange behavior... I added a second book in the same category and it showed up the right way. Created the first book in copy exactly the same way as before and it worked good. Deleted the first book. Ok.

Now the problem is how to change the order of the books in the categories page.

How do I do that?

Hello,

Open "Options" tab on menu item settings page and configure sorting parameters.

Well, if the documents are not named in the right way and the document dates aren't in the right order, the only way is to name the documents with leading numbers. That doesn't look good. Maybe there is a way in future updates to manually order the documents in Books?
