## Enable SSL (https)

Posted by gdsd - 2018/01/29 16:19

---

Hi!

I have enabled ssl on my website.

However, "ARI Social Harvester" displays images without using ssl/https.

For example, a picture from facebook would look like this:

This prevents my website from being fully secure, since the picture is not from a secure source.  
(Also: The "alt" attribute is empty, which AFAIK does not conform fully to the "W3C html5" standards.)

Is there a way to fix this? (future-proof, without future updates breaking it)

If not, I would suggest this for the next version (hopefully soon), so I can enable ssl for all image sources as well as add a default "alt" attribute.

Hello,

Thank you for your report. We will check it and update the extension soon. Try to do it within 3-4 days.

I don't know if there was something changed on newest version of the plugin but I wanted to give some feedback about the issue.

I am using version 1.2.6

As it stands right now, the link uses https but the thumbnail does not.

For example:

html looks like this:

This prevents the page being rated 100% secure.

Hello,

---

Download the component in "Member Area" and update it on your site. It should help.

PS: Currently v. 1.2.6 will be shown in "Member Area". Ignore it and download the component.

Regards,  
ARI Soft

I downloaded current version.

I can only test it with facebook-pictures right now and I can confirm that they use https now.

Thanks!
