Problem with resized page places a button instead.

Posted by Internaut - 2018/12/15 21:01

_____

Thanks for reading my problem. You may want to just jump down to the "QUESTION" below.

Problem:

When the page loads above about 950 pixels wide, the slider appears and plays almost fine.

But, below 950 pixels, there is no slider, just a button (image attached). Pressing the button starts the slider.

http://www.ari-soft.com/images/fbfiles/images/_950pixles.JPG

Joomla 3.9.1
This is a 1 page Ari-slider only site
Protostar Template
Disabled "Home" button
All images are 1000x500
PHp V. 7.2.

Also, when the page is 950+ in pixel size, the image is larger than page width and causes a scroll bar at the bottom to appear.

QUESTION:

How might I load the page at any responsive size without he button, and have the slider start regardless of page size?

And, how might I re-size image so there is no slider at bottom of page?

NOTE: I am still trying things on site and it is off-line at the moment as I do this but would be happy to open it up for review when asked to.

Any helps is always greatly appreciated,

I.
p.s. When I click "Preview" this post, it takes me to a blank, no code, page. Ergo, I had to Submit to see my mistakes.. hence the many Submits.

_____

Hello,

Is it possible to see the problem anywhere?

Regards,
ARI Soft
