## Create as module / pagebuilder

Posted by jackson - 2021/07/28 02:54

---

Hi,

I just installed this plugin and playing around.

Wondering is there any options to add the plugin as module to show at frontend instead of using the menu component?

Found!

Way inside the com folder

Hello,

Installation package contains "CalendARI" module which can show calendar(s) at the selected module position and "System - CalendARI" plugin. The plugin can embed calendars in any content.

Thanks!

I found the folder to install the module and plugin.  
All works well now.

One more question, would it possible to use custom field of article as event date instead using article publishing / created date?

K2 event source doesn't support this feature. Any field can be used as event date for "Database" source, but it requires some SQL knowledge to build correct SQL query.

Yeah ~

Thanks for the advice.
