
Dleay JQuery not working with quiz

Posted by alejandrow - 2021/04/17 09:07

Hello, so JQuery is needed for the quiz to work properly, I have noticed. But when I tried to delay JQuery it makes it not possible to answer the questions.

Is there some way to make the plugin work without JQuery? This is the only plugin on my site that can't have JQuery delayed until user interaction. This would be a huge performance improvement.

Hello,

Could you specify what do you mean under "delay" jQuery? Use "defer" attribute for tag? Is it possible to see "delayed" jQuery with the plugin on your site?

Delay JQuery means that it won't be loaded on initial web browsing load. It will be loaded first when a user interacts with the page, such as clicking or scrolling etc.. It's a great way to focus on the essential resources needed to load the page. And since there is no need to load JQuery before someone scrolls down to the quiz, it should work in theory.

But it breaks the plugin, and it will only display a check in the check box, but won't display the answer or register the choice when JQuery has been delayed. So I'm wondering if this is something you could look into, and see if the plugin can be further improved. It's really awesome, and this would be top notch since performance will only be more important now from Google.

We will add support of delayed jQuery to the next plugin PRO version. We will release it within next week.

Sorry for the delay. Add inline_scripts="1" attribute to shortcode. It will look like:
