
A bug in Trivia quizzes

Posted by Giorgos93 - 2021/08/26 10:57

Hi! I've always had a smart scroll enabled in your plugin, but recently I decided to turn it off. And when I did it, I noticed a problem, that happens with Trivia quizzes only.

When I pass my quiz on mobile phone (iPhone 6) and press the final answer, then my screen suddenly scrolls up. On PC everything works fine. Here is a gif with this problem: <https://ibb.co/WyDH6hb>

I thought, that it's related to my custom css/js code, but I deleted it fully, and the problem still appeared.

Can you solve this? Here is a quiz with this problem: <https://litfan.ru/testy/test-kak-horosho-ty-znaesh-garri-pottera/>

Hello,

Open "ARI Stream Quiz -> Settings -> Advanced" page and populate "Custom JS code" parameter with the following code:

```
(function() { var quiz = $(''.ari-stream-quiz').ariStreamQuiz();var oldShowResultsHandler = quiz.showResults;
quiz.showResults = function() { oldShowResultsHandler.call(quiz, true); }; })();
```

It disables auto scroll when show results page.

Regards,
ARI Soft

Unfortunately, this js code didn't work. Maybe you wrote it wrong? It also added an error to Dev Console: Uncaught TypeError: \$ is not a function.

And one more thing: I've just tried to make a repost of Trivia quiz in Facebook, and not only it didn't put my custom text with predefined variables (it just inserted a quiz name), but when I follow a reposted quiz link from Facebook, there is '?asq_share=' added with a lot of other symbols at the end of link. And the same error is shown in console: 'Uncaught TypeError: \$ is not a function', but now because of '?asq_share=', not because of your js code.

I hope for your help.

And btw, I don't think, that the problem is caused by autoscroll. When users select the last answer, extra content is added to each answer (X with 'wrong' and " with 'right'). Maybe, this makes the screen to 'jump' up?
