## How are personality results calculated or scored?

Posted by strategicdeals - 2023/04/07 20:08

---

I'm trying to create my first personality quiz (ARI Stream Quiz PRO) but I don't understand the logic that I need to use to build the personality types and the questions that will give users a result.

I tried to find a guide to build these personality quizzes, but there's only documentation to help you install the plugin and other technical details, not explaining the logic of scoring the results.

So I created "5 personality types" and I'm planning about 15 questions with 5 options each. I see that I can give a score to each question. But what do these scores mean and how do they result in one personality type and not others?

Hello,

Score for each personality can be set per each answer. The plugin calculated score for each personality based on provided answers at the end of test and selects the personality with maximum earned score as main personality.

Hi,

Thanks for the response, but I'm still confused! I understand that the plugin is calculating the score based on the answers which I see I can attribute a specific number for each. What I don't understand is how does it match the answers with the correct personality at the end.

When creating personalities there is no score associated with any of them. I can only give them a title and add images and text. I am assuming the score is based on sorting, is it? The first personality being the lowest score and the last personality being max score?

For example if set 5 points for "Personality 1", 3 points for "Personality 2" for "Answer 1-1" from "Question 1" and 1 point for "Personality 1", 2 points for "Personality 2" for "Answer 2-1" from "Question 2" and quiz taker chooses these answers then "Personality 1" will have 6 points and "Personality 2" will have 5 points. In this case "Personality 1" will be primary personality. If several personalities are shown then "Personality 1" will be shown on top and "Personality 2" below.

Earned score can be shown with title. For this see "Title on result page" parameter in "This parameters section is used to configure sharing content for personality quizzes" section on "ARI Stream Quiz -> Settings -> Sharing" page. It is possible to use some predefined variables like `{{userScorePercent}}`, `{{score}}` and etc.

Thanks!

I got it!

I guess I was expecting some complicated algorithm that did some kind of obscure math, but it's very simple!
