
Contact Form 7 Connector Integration with Zapier

Posted by veejay41 - 2017/08/18 03:25

Hello,

So I'm using the CF7 connector to integrate with Zapier to pull in the first name, email address, company etc. and insert this as a contact into AGILE CRM.

However, the first name and email fields are not getting pulled by Zapier and since these are required fields, the contact does not get created in Agile CRM and there is an error each time.

The web hooks have been tested and are successful. If I hard code the First Name and email fields in the Zap and then submit the contact form, the contact gets created successfully in Zapier

<https://www.screencast.com/t/AKkPF2pJkMIT>

Above screen shots are for my zap that's been created and I have pulled Your Name and Your Email from step 1. I was able to successfully test the Zap too.

Below is where I've copied the web hook and tested it successfully.

Can someone please help me?

Thanks so much!

Hello,

Could you enable application/error logs in plugin settings and check Zap history like described below and send logs/exported history by email so we can investigate the problem?

- Open "CF7 Connector" page on backend part of your WordPress site and enable "Application log" and "Debug log" checkboxes.
- Submit the form on your site and after this check log on Zapier site for the Zap. For this open "Task history" page and check available records. If you have a paid Zapier account then select record(s) and click "Download" button. Send the downloaded file to us please so we can investigate the problem.
- Open "CF7 Connector" page on WordPress site and click "View log" links for "Application log" and "Debug log". If they contain any records, send them to us please so we can investigate the problem.

Regards,
ARI Soft
